

NOVEMBER 1965

Cotton production in the United ates during 1965-66 is expected exceed disappearance for the th consecutive year. The large 85 crop--placed at 15.1 million les on November 1--reflects recd yields.

-221

Disappearance of all kinds of ton during 1965-66 is estimated 13,3 million bales, up slightly om 13,2 million a year earlier. Il use of cotton has been at a the level in recent months and for 65-66 is estimated to total 9.3 Illion bales--the largest since 52-53. U.S. exports of cotton are pected to total around 4 million les, down slightly from 4.1 miln a year earlier.

SUMMARY

On November 3, a new program became effective for the 1966-69 crops of upland cotton. The new law continues the 1-price program, maintains the national minimum acreage allotment at 16 million acres, and retains the domestic allotment concept. But the new bill differs from the present program in several respects. Producers who cooperate by planting less than the allotted acreage will receive direct payments. At the same time, price support loans are dropped below world price levels in an effort to stimulate the movement of cotton into domestic and export markets.

The new program establishes a domestic allotment within the farm allotment of not less than 65 percent of the farm allotment but, except for small farms, a reduction in 1966 of at least 12.5 percent from each farm's share of the 16-million acre allotment is required for participation in the program. Producers may divert up to 35 percent of their farm allotment. Payments for CS-221

diverted acreage will be at the rate of not less than 25 percent of the parity price multiplied by the projected yield of the acreage required to be retired. Producers who divert an additional portion of their allotment, up to a total of 35 percent, may receive up to 40 percent of parity on the additional acreage. The payment rate on all acreage diverted for the 1966 crop will be 10.5 cents per pound. (Small farms--those with allotments of 10 acres or less or those farms whose projected production of the farm allotment totals 3,600 pounds or less--are exempt from the mandatory acreage reduction. They will receive the same level of price support provided to other producers and a diversion payment as if they had reduced their acreage 35 percent and also may receive additional payments if they actually divert a portion of their allotment.)

The basic loan level for Middling 1-inch cotton to cooperators is set at 21 cents per pound for the 1966 crop, down from 29 cents for 1965. For each of the crops in 1967 through 1969, the loan level may not exceed 90 percent of the estimated world market price during each marketing year. Direct payments are also provided to producers in an amount which, when added to the loan rate, will reflect not less than 65 percent of parity on the projected yield multiplied by permitted acreage (87.5 percent of the acreage allotment) or at a rate of not less than 9 cents a pound on the domestic allotment. The rate for the 1966 crop will be 9.42 cents. The new legislation permits holders of 1965 acreage allotments to stay out of the program, forego all price support and payments, and plant cotton in excess of their acreage allotment and sell their cotton for export without penalty. However, such nonprogram acreage may not exceed 250,000 acres for the entire United States in 1966, and producers who do not participate in the program and who plant some of this acreage must export their entire production.

Carryover of all kinds of cotton on August 1, 1966, is expected to total about 16.2 million running bales (16.0 million of upland cotton). This compares with 14.3 million bales last August 1 and the previous high of 14.5 million in 1956.

The sharp increase in carryover during 1965-66 is expected because the large 1965 crop exceeds expected disappearance. Production this year is being maintained by record-high yields; cotton acreage was reduced 3 percent by the Domestic Allotment Program. Disappearance of cotton during 1965-66 is expected to total around 13.3 million bales, up slightly from 13.2 million bales a year earlier.

Mill consumption of all kinds of cotton during the 1965-66 crop year is estimated at about 9.3 million bales (9.1 million bales of upland cotton). This would be slightly greater use than during 1964-65 and over 600,000 bales above use in 1963-64.

Slightly greater cotton consumption is indicated this year by the high rate of use in recent months and by the high level of unfilled orders for cotton cloth at mills relative to inventories of cloth. However, the rapid increase ⁱⁿ use of non-cellulosic staple fibers has modified the increase in cotton consumption. Production of fabric blends, usually including non-cellulosic fibers as the major fiber, is increasing sharply. These blends are replacing fabric made of 100 percent cotton. To illustrate, at the end of September 1965 there were 15.0 million cotton-system spinning spindles consuming 100 percent cotton, down 100,000 from a year earlier. Spindles consuming other than cotton rose by 600,000 during the same period. Sharp price reductions for non-cellulosic fibers in recent years have contributed to their expanded use.

In terms of gray goods fabric, polyester blends with cotton are the most common fabric blend. Bureau of the Census data indicate that the weekly average rate of production of these blends in August 1965 was 47 percent higher than in the previous August. Cotton gray goods production was up about 1 percent. For the January-August 1965 period, fabric blend production was up nearly 41 percent from a year earlier, while cotton fabric production was up 1 percent

While the use of non-cellulosic staple fibers has continued to reach record levels in recent months, the increasing rate of use of rayon and acetate staple fibers has slowed. The rate of use of these fibers in September was almost 4 percent below a year earlier, although use showed some recovery from August, when the rate was lowest since April 1963.

Per capita mill consumption of cotton for calendar 1965 is estimated at 22.8 pounds, up 3 percent from 1964. Cotton's share of total fiber consumption, however, is expected to show a further slight decline for the year to an alltime low of 52.9 percent. Man-made fiber consumption is expected to total a record high in 1965. Of these fibers, non-cellulosic man-made fibers are showing the sharpest gain and may rise nearly 19 percent. Per capita consumption of all fibers, estimated at 43 pounds, would be up 6 percent from 1964 and the highest since 1951. In terms of actual pounds of fibers, 1965 consumption will likely be the largest on record--over 7 percent above the previous high in 1964.

U.S. exports of cotton during the 1965-66 crop year are expected to total around 4 million bales, down slightly from 4.1 million a year earlier. The rise in consumption to a record high in foreign free-world countries is expected to be largely offset by a rise to a record high in production, and some working down of foreign stocks is expected.

U.S. exports fell sharply during the 1964-65 crop year from a year earlier because record production in foreign free-world countries continued to close the gap between cotton consumption and production in these countries. Consumption of cotton has been rising in foreign countries along with corresponding population increases and higher levels of economic activity. However, sharp advances in the use of man-made fibers have modified the upward trend in cotton consumption. For example, during the past crop year total foreign consumption of cotton rose about 1.5 million bales, while man-made fiber consumption abroad increased by the equivalent of 3 million bales of cotton. At the same time, production of cotton has trended upward sharply in foreign countries-at a faster rate than has consumption. This production increase has resulted from an expansion in cotton acreage and higher yields. Acreage has responded to the profitabllity of cotton as a cash crop, as an earner of foreign exchange, and as a result of government encouragement in many countries. Yields are trending upward as a result of improved technological and cultural practices, as well as increasing use of water resources and land better suited to cotton production.

U.S. imports of cotton textiles have been running at record levels during calendar 1965. Large imports reflect the expansion in general economic activity in the United States, a high level of activity within the domestic textile industry, and rising cotton textile prices despite reduced raw cotton costs. Imports for January-August 1965, on a raw cotton equivalent basis, totaled 495,000 bales, nearly 18 percent above the same period in 1964. The sharpest increase in imports was in cotton cloth, which rose nearly 35 percent. Imports of cloth are sensitive to changes in prices for cloth in the domestic market. U.S. exports of cotton textiles for the first 8 months of 1965 were down about 25 percent from a year earlier, partly because of rising costs for domestically-produced cotton textiles. Net imports of cotton textiles were equivalent to 262,000 bales during the first 8 months of 1965, up sharply from 112,000 bales for January-August 1964.

RECENT DEVELOPMENTS AND OUTLOOK

New Cotton Legislation Enacted

On November 3, a new program became effective for the 1966 through 1969 crops of upland cotton. The new legislation continues the 1-price program, maintains the national minimum acreage allotment at 16 million acres, and retains the domestic allotment concept. However, the new bill differs from the present program in several respects. Although the national acreage allotment remains at 16 million acres, strong incentives are provided in the form of direct payments to producers who cooperate by planting less than their allotted acreage. Most producers likely will participate in the program. At the same time, price support loans to producers are dropped below world price levels. This is expected to stimulate the movement of cotton into domestic and export markets.

Major provisions of the new bill are as follows:

(1) Continues the 16-million-acre national minimum allotment, but establishes a domestic allotment within the farm allotment of not less than 65 percent of each farm allotment.

(2) Requires at least a 12.5-percent reduction from the farm acreage allotment for participation in the program--except for small farms.

(3) Provides loans to cooperators, on all production, at not more than 90 percent of the estimated world market price for Middling l-inch at average location in the United States (for 1966, the loan level is 21 cents for Middling l-inch cotton at average location). In addition, price support payments are provided to cooperators in cash or kind in an amount which, when added to loan, will reflect not less than 65 percent of parity on the projected yield multiplied by permitted acreage (87.5 percent of the farm allotment), or at a rate of not less than 9 cents per pound--the rate for the 1966 crop will be 9.42 cents.

(4) Provides payments for diverted acreage at the rate of not less than 25 percent of the parity price at time of announcement multiplied by the projected yield of the acreage required to be diverted (12.5 percent). Farmers may divert an additional 22.5 percent of their effective allotment, to a total of 35 percent, and they will receive up to 40 percent of parity on the balance of 22.5 percent. The payment rate for all diverted acreage for the 1966 crop will be 10.5 cents.

(5) Contains a provision for small farms. Farmers with allotments of 10 acres or less or those whose projected production of the farm allotment totals 3,600 pounds or less are not required to reduce their acreage; but they will receive the same level of price support provided to other producers and a land diversion payment as if they had reduced their acreage 35 percent. If a small farmer chooses to reduce his acreage to any level down to 65 percent of his allotment, he will receive an additional diversion payment at the rate established for voluntary diversion of acreage.

(6) Permits producers with 1965 allotments to stay out of the program and plant acreage in excess of their allotments. However, they would receive no price support or payments and their entire production would have to be exported. The national total of such nonprogram acreage could not exceed 250,000 acres in 1966. This total would be reduced in 1967, 1968, and 1969 if the estimated reduction in the carryover of cotton were less than 1 million bales during the preceding crop year.

(7) Requires the Commodity Credit Corporation to sell upland cotton for unrestricted use at the same price that it sells cotton for export, but in no event at less than 110 percent of the loan rate; except, in marketing years when estimated production is less than disappearance, CCC is required to sell or make available for unrestricted use this difference at current market prices. Also, additional cotton will be available for CCC disposal. Payments to producers will be made through certificates which CCC will redeem for cotton at a value per pound of not less than the loan rate. CCC may assist producers in the marketing of certificates and redeem them in cash.

(8) Continues the release and reapportionment program; farmers planting no cotton will be eligible for diversion payments on 12.5 percent of the allotment, and they may release 87.5 percent of their allotments. (9) Permits sale or lease of cotton acreage allotments among farmers within a county, or in other counties of the same State if approved in a referendum by farmers within the county.

(10) Provides under certain conditions that the Secretary may permit all or any part of diverted acreage to be devoted to the production of specified minor crops including guar, sesame, safflower, castor beans, flaxseed, and others.

(11) Provides that as much as 50 percent of producer payments may be made in advance of the determination of performance and the balance will be made at such time as the Secretary prescribes.

(12) Establishes a cropland adjustment program. Farmers may retire land from production under 5- to 10-year contracts, with the requirement for 1966 that all of at least one surplus crop be placed in the program. For 1966, however, the ASCS county committee may request that cotton acreage be excluded from coverage under this program by the Secretary.

Record Carryover In Prospect

The U.S. carryover of all kinds of cotton on August 1, 1966, is expected to total about 16.2 million running bales (16.0 million of upland cotton). This would be up from 14.3 million bales on the past August 1 and well above the previous high of 14.5 million in 1956. (See fig. 1.)

The sharp increase in carryover during 1965-66 is expected because the large 1965 crop exceeds expected disappearance. Production is being maintained this year at near the 1964 level of slightly more than 15 million bales--de-spite a 3-percent drop in acreage--because of record yields. Disappearance of cotton during 1965-66 is expected to total around 13.3 million bales, about the same as the 13.2 million bales of a year earlier. (See table 7 and cover cart.)

Commodity Credit Corporation Stocks Record High

CCC stocks of all kinds of cotton on August 1, 1966, are likely to be up about 2 million bales from the past August 1 when they totaled a record 11.6 million bales (including unsold ex-stockpile cotton). This was up from 10.4 million bales on August 1, 1964. (See fig. 2 and tables 1, 10, and 11.)

Commercial holdings are not likely to change sharply during the 1965-66 crop year. There was some rebuilding of stocks by commercial interests during the 1964-65 crop year. On August 1, 1965, such stocks totaled 2.7 million bales, up from 2.0 million on the previous August 1. Stocks were reduced during the 1963-64 crop year because of uncertainty relating to new cotton legislation and anticipated declines in market prices during 1964-65 as a result of the 2.5-cent reduction in the support price for the 1964 crop.

Table 1 .-- Cotton, all kinds: Stocks held by CCC and others, United States, 1950 to date

1/ Includes cotton pooled, owned, loans outstanding and cotton released from the stockpile. Foreign stockpile cotton included by the Bureau of Census totaled 7,168 bales on August 1, 1962, 61,168 on August 1,1963, 27,474 bales on August 1, 1964 and 18,307 bales on August 1, 1965. 2/ Running bales. 3/ Preliminary.

1965 Production Maintained By Record Yields

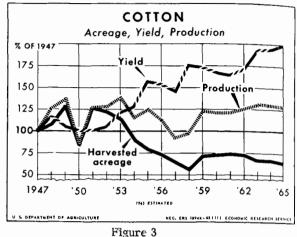

The 1965 crop of all kinds of cotton was estimated at 15,052,000 running bales as of November 1. This is down only slightly from the 1964 crop of 15,148,000 bales. Of the total, upland cotton accounts for 14,968,000 running bales, slightly lower than the 1964 crop of 15,031,000 bales. The 1965 crop of American-Egyptian cotton, at 83,500 running bales, is down sharply from the 1964 total of 116,700 bales. (See table 9.)

The 1965 crop of all kinds of cotton is being produced on 13,632,000 acres, down 3 percent from 14,060,000 acres harvested in 1964 and the smallest acreage since 1958. Acreage available for planting in 1965 was reduced by about ¹ million acres by producer participation in the Domestic Allotment Program.

CS-221

The estimated yield per harvested acre for 1965 is a record 531 pounds. This is up from the previous high of 517 pounds in 1964 and 67 pounds above the 1959-63 average. By major producing States, yields are showing the sharpest increases in Texas and Oklahoma. In Texas, the indicated yield of 410 pounds is up 62 pounds from a year earlier. Of total U. S. acreage, about 40 percent is harvested in Texas. (See fig. 3 and tables 12, 13 and 14.)

Factors contributing to the yield increase this year include more favorable growing conditions in some areas, particularly in the Southwest, use of land better suited to cotton production,

greater use of irrigation, and increased use of fertilizer, insecticides, and herbicides. Also, a larger acreage was "skip-row" planted this year, a practice that results in higher yields. A total of 3.0 million acres was planted in 1965 with less than 4 rows skipped. This compares with 2.3 million acres in 1964. (See table 15.)

<u>Announced; Rules Revised</u> For Skip-row Planting

On October 14, USDA announced a national acreage allotment of 16 million acres for the 1966 crop of upland cotton. This is the same allotment as set for the 1963 through 1965 crops and the smallest permitted under present law. The allotment has been set at the minimum in recent years because of the supplydemand situation.

New cotton legislation does not change the requirement for establishing by October 15 of each year a minimum national acreage allotment and marketing quota for the following crop year. Provisions of the new legislation do provide producers an opportunity to voluntarily reduce their cotton plantings and requires at least a 12.5-percent reduction in allotments for participation in the program. Thus, the new program should result in considerably less production next year than the national marketing quota of 15,267,000 bales announced for the 1966 crop.

November 23 has been set as the date for the referendum on 1966 upland cotton marketing quotas. For the quotas to continue in effect, at least twothirds of farmers voting must approve. If quotas are not in effect for the 1966 upland cotton crop, the allotment program will remain in effect and price support will be available for cooperators at 50 percent of parity, as provided by law. Marketing quotas are in effect for the 1965 crop, having been approved by 96.3 percent of cotton producers. Distribution of the 1966 acreage allotment by States, including the national acreage reserve of 200,000 acres, is about the same as in 1965. Nearly one-half the total was allotted to the Southwest, which includes Texas, Oklahoma, and Kansas. (See table 2.)

1/ Includes acreage added by Choice B selection.

Computed from reports of the Agriculture Stabilization and Conservation Service.

On October 27, USDA announced revised rules for measuring cotton when planted in skip-row patterns for compliance with acreage allotments. The new rules will become effective beginning with the 1966 crop.

The announcement stated, in part: "On April 23, 1965, the Department announced proposed changes in the skip-row planting rules (USDA 1299-65) and invited comments by interested persons.

"The rules announced today are less restrictive than those included in the April 23 proposal, but somewhat more restrictive than current rules.

"In skip-row plantings, strips of cotton rows are generally alternated with strips of idle land. Under present rules, the idle land beyond one-half of the normal width of a row is not counted as cotton when computing the acreage of cotton in a field. This, in effect, spreads the allotment over more acreage. Under the new rules, a part of the idle land will be considered cotton acreage for allotment purposes, except where cotton is planted in a pattern with 4 or more rows skipped. In a change from last spring's proposal the rule for plantings with 4 or more rows skipped will remain the same as it has been for many years. For other skip-row plantings where the row width is 40 inches, not only the land planted to cotton but also the 32 inches (an additional 12 inches over the 20 inches now counted) beyond the outside rows next to the idle land will be charged as cotton acreage under the allotment program." Examples of acreage charged as planted to cotton under current and revised rules are given in table 3.

Table 3.-- Upland cotton: Examples of acreage measurements under current and revised rules for skip-row planting patterns, 40 inch rows, 1966 crop.

Agricultural Stabilization and Conservation Service.

<u>Mill Consumption of Cotton At High Level;</u> <u>Rayon and Acetate Staple Below Year Earlier</u>

Mill consumption of all kinds of cotton during the 1965-66 crop year is estimated at about 9.3 million bales. This is up from 9.2 million bales used in 1964-65 and the most since 1952-53. Estimated total consumption includes 9,100,000 bales of upland cotton and 155,000 bales of extra-long staple. (See tables 7, 8, and 9.)

Lower net costs of upland cotton to domestic users, provided for in legislation enacted in April 1964, and a continued expansion in general economic activity are contributing to the expected consumption increase.

A slightly higher level of cotton consumption is indicated this year by the high rate of use in recent months and the high level of unfilled orders for cotton cloth at mills in relation to inventories of cloth. The seasonally adjusted daily rate of upland cotton consumption in September, at 34,630 bales, was down slightly--0.5 percent--from August but was nearly 1 percent above the same month a year earlier. The stock-unfilled order ratio at the end of September was 0.21, down from 0.38 in September 1964. The use of rayon and acetate staple fibers on cotton-system spinning spindles in September showed some recovery from August, which was the lowest rate since April 1963. But use was still down nearly 4 percent from September 1964. The rate of use of non-cellulosic fibers continued to trend upward in September--reaching a new high. (See figs. 4 and 5, tables 16 and 17.)

The rapid increase in the use of non-cellulosic staple fibers is modifying the increase in cotton consumption this year. Production of fabric blends, which include non-cellulosic fibers as the major fiber, are increasing rapidly. These blends are replacing all-cotton fabric. To illustrate, at the end of September 1965, there were 15.0 million cotton system spinning spindles consuming 100 percent cotton, down over 100,000 from a year earlier. At the same time, spindles consuming other than cotton, at 3.9 million, were up 600,000 from a year earlier.

In terms of gray goods fabric, polyester blends with cotton are the most common fabric blend. Bureau of the Census data indicate that the weekly average rate of production of these blends in August 1965 was 47 percent higher than in the previous August. Cotton gray goods production for the same period was up nearly 1 percent. For the January-August 1965 period, fabric blend production rose nearly 41 percent from a year earlier, while cotton fabric production was up about 1 percent.

On a cotton equivalent basis, use of total man-made staple fiber on cotton-system spinning spindles in September, (5-week month), amounted to nearly 252,000 equivalent bales of cotton. Of this total, rayon and acetate staple was equivalent to 140,000 bales, while non-cellulosic staple use was 112,000 bales. Cotton consumption totaled 886,000 bales in September. (See table 18.)

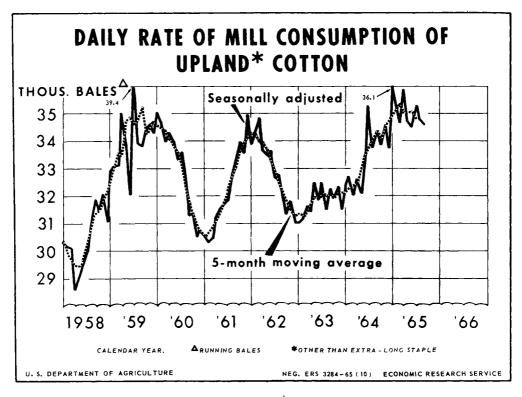

Figure 4

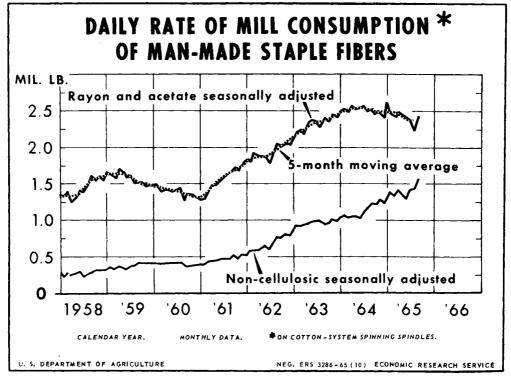

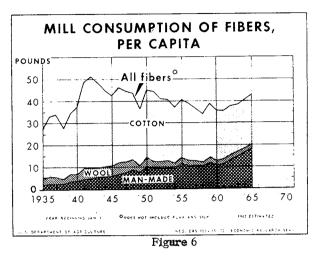

Figure 5

CS-221

<u>1965</u> <u>U.S. Per Capita Cotton</u> <u>Consumption</u> <u>Higher</u>

Per capita mill consumption of cotton for calendar 1965 is estimated at 22.8 pounds, up 3 percent from 1964. However, cotton's share of total fiber consumption is expected to show a further slight decline for the year to an all-time low of 52.9 percent. Manmade fiber consumption is expected to reach a new record high in 1965. Of these fibers, non-cellulosic fibers are showing the sharpest increase and may rise nearly 19 percent. Per capita wool consumption is expected to be over 5 percent higher in 1965. Per capita consumption of all fibers, estimated at 43 pounds, would be up 6 percent from

1964 and the highest since 1951. In terms of actual pounds of fibers, 1965 consumption will likely be the largest on record-over 7 percent above the previous high in 1964. (See fig. 6 and table 19.)

During most of calendar 1965, cotton consumption has been at a high level. Lower cotton costs to domestic users have stimulated the use and slowed the switch to rayon and acetate staple fibers. The sharp upward trend in the use of non-cellulosic fibers has continued, however. Sharp price reductions for these fibers in recent years have contributed to their rising use, particularly in fabric blends. For example, the price of a 3.0 denier polyester staple fiber Was reduced from \$1.14 cents per pound in January 1964 to 84 cents a pound in September 1965. (See table 20.) Polyester staple is the fiber most commonly used with cotton in the production of fabric blends.

Ratio Of Mill Stocks Of Cotton Cloth To Unfilled Orders Steady

The seasonally adjusted ratio of mill stocks to unfilled orders for cotton cloth has remained stable in recent months. The ratio at the end of September was 0.21, same as the previous month but down sharply from 0.38 in September 1964. (See table 21.) Changes in the ratio usually precede by several months changes in the rate of consumption. Declines in the ratio indicate increases in the rate of cotton consumption.

Inventories of cotton cloth increased slightly during September but were down 12 percent from September 1964. Unfilled orders also increased slightly during September and were 54 percent above the total for September 1964.

U.S. Imports of Cotton Textiles Up Sharply From A Year Earlier, Exports Lower

The expansion in general economic activity in the United States, a high level of activity by the U.S. textile industry, and rising cotton textile prices have contributed to sharply increasing cotton textile imports during calendar 1965. Imports, on a raw cotton equivalent basis, at 61,000 bales during August, were up 21 percent from the same month a year earlier. Imports for January-August 1965 were 495,000 bales, nearly 18 percent above the same period in 1964. The sharpest increase in imports was in cotton cloth, which rose nearly 35 percent. Imports of cloth are sensitive to changes in domestic prices.

U.S. exports of cotton textiles have continued at low levels in recent months, partly because of rising costs of domestically-produced cotton textiles. For January-August 1965, exports were equivalent to 233,000 bales of cotton, down sharply from 309,000 bales for the first 8 months of 1964. (See tables 22 and 23.)

For the January-August period of 1965, imports of cotton textiles exceed exports by 262,000 bales, up sharply from 112,000 for the same period a year earlier. Thus, the equivalent final domestic use of raw cotton was 262,000 bales larger than the volume of raw cotton put into process by domestic textile mills. Final domestic consumption in the 1964-65 crop-year, at 9.5 million bales, was up 0.8 million from 1963-64.

Imports of man-made fiber textiles, on a raw fiber equivalent basis, also have shown a sharp advance in 1965. For January-August, imports at 45 million pounds were up from 30 million in 1964. During the same period, exports fell from 116 million pounds to 88 million. (See tables 24 and 25.)

<u>Upward Trend in Cloth Prices Halted;</u> <u>Mill Margins Continue Rise</u>

The average wholesale value of the fabric (20 constructions) made from a pound of cotton in October was 65.23 cents, down from 65.30 cents in September but sharply higher than 61.33 cents in October 1964. Prior to September of this year, prices had risen each month since July 1964. A sharp increase in demand for cotton cloth, along with low inventories of cloth and increases in wage rates for textile mill workers, has exerted upward pressure on prices.

Mill margins--the spread between the price of a pound of cotton and its approximate cloth equivalent--continued their upward trend through October. They have risen each month since July 1964 and in October were the highest since June 1951. The October advance in margins was caused by a drop in prices paid by mills for cotton. (See table 26.)

U. S. Spot Market Prices Below Year Earlier

The average 15 spot market price for Middling 1-inch cotton in October was 29.68 cents per pound, down from 29.72 cents a month earlier. (See table 27.) Lower prices thus far this season are in line with the reduction in the support price. The basic support price for Middling 1-inch cotton, at average location, for the 1965 crop is 29.00 cents per pound, down from 30.00 cents for the 1964 crop and 32.47 cents for the 1963 crop. The support price for the 1966 crop will be 21 cents per pound.

The average price received by farmers for upland cotton in mid-October was 29.39 cents per pound. This was down slightly from September and 1.56 cents below October 1964. (See table 27.) Prices received by farmers reflect factors which include support prices, supply-demand factors, and quality of cotton produced. The minimum support price (average of the crop) for 1965 upland cotton is 28.31 cents per pound, down from 29.30 cents for the 1964 crop.

Ginnings From 1965 Crop Slightly Below A Year Earlier; Quality Lower

Ginnings of the 1965 crop prior to November 1 totaled 8.9 million bales, down from 9.1 to the same date a year earlier. These ginnings represented 59 percent of the estimated 1965 crop.

The quality of ginnings from the 1965 crop is below a year earlier. Adverse weather in some States has affected quality. According to the Consumer and Marketing Service, the grade index of upland cotton in this season's ginnings has been at a record low.

<u>Micronaire Readings To Be Quality</u> <u>Factor For 1965 Upland Cotton Supports</u>

USDA announced on October 25, 1965, that micronaire readings would be an additional quality factor for 1965-crop upland cotton going under price support loan after October 31, 1965. However, loans disbursed after October 31 on cotton classed prior to that date on which the classification cards do not show micronaire readings will be made without regard to micronaire.

The announcement stated, in part:

"Mike readings determine the fineness and maturity of the fiber. These qualities affect the spinnability and value of the cotton, and mike readings are widely used in commercial cotton transactions. The micronaire premiums and discounts will be in addition to premiums and discounts for grade and staple announced May 17, 1965, (USDA 544-65). "A mike reading will be determined free of charge and shown on the classification memorandum by the cotton classing offices of the Consumer and Marketing Service for each bale of 1965-crop upland cotton classed after October 24, 1965, for producers."

A schedule of premiums and discounts for micronaire readings of 1965crop upland cotton is shown in table 4.

<u>1965-66 Cotton Exports May be About</u> the same As A Year Earlier

U. S. exports of upland cotton during the 1965-66 crop year are expected to total around 4 million bales, slightly below 1964-65. (See tables

7 and 29.) The rise in consumption to a record high in foreign free-world countries is expected to be largely offset by a rise to a record high in production and some working down of stocks is expected abroad in 1965-66.

Foreign Free World Production And Consumption Expected To Be At Record Level

Foreign free-world cotton production for the 1965-66 crop is expected to total a record 23.2 million bales. This is 400,000 bales above the past year and the sixth straight year that production has set new highs. (See tables 30 and 32.) The expected record production is resulting from increased acreage and slightly higher average yields.

Substantial increases in production this year are expected in India, Pakistan, and Iran. Reduced production is in prospect for Mexico, Nicaragua, El Salvador, and Turkey.

Acreage planted to cotton in the foreign free-world during 1965-66 is estimated at a record 50.2 million acres, according to the Foreign Agricultural Service. This would be 300,000 acres larger than the previous year. Increased acreage is estimated for Mexico, Guatemala, Colombia, Egypt, and Syria.

By areas, 1965-66 cotton production is expected to be at record levels in the Middle Eastern countries, with the exception of Turkey; at or near-record levels in Africa as well as India and Pakistan; about the same as in 1964-65 in South American and European countries; and below a year earlier in Central American countries and Mexico.

Agricultural Stabilization and Conservation Service,

Production in Communist countries in 1965-66 is expected to total 13.7 million bales, 300,000 bales below 1964-65. Mainland China's crop may be slightly larger than a year earlier; however, the USSR's crop is expected to be about 400,000 bales below a year earlier because of slightly reduced acreage and lower yields resulting from a shortage of irrigation water in some areas. (See tables 32 and 37.)

Foreign free-world consumption of cotton during 1965-66 is expected to total a record 25.3 million bales, up 0.5 million bales from the previous record high in 1964-65. (See table 30.) The increased consumption during 1965-66 is expected to occur in foreign free-world producing countries; little change is expected in importing countries.

Stocks of cotton in the foreign free-world totaled about 10.4 million bales on August 1, 1965, the same as a year earlier, but are expected to decline about 600,000 bales during 1965-66. This decline is expected to occur mostly in exporting countries.

Free-world net exports of cotton to Communist countries is expected to total about 2.4 million bales, up 0.4 million from 1964-65.

The difference between foreign free-world production and consumption has continued to narrow in recent years. Since 1947, consumption has increased at an average annual rate of 668,000 bales per year. (See fig. 7.) During this

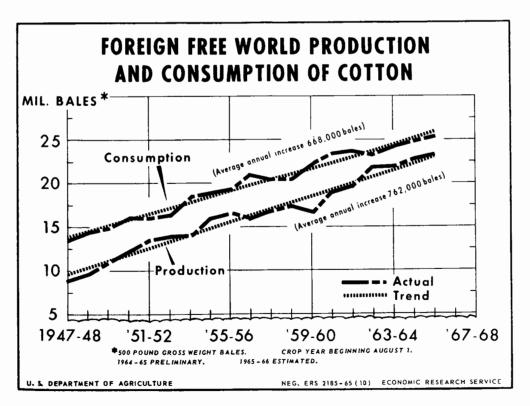

Figure 7

CS-221

same period, production in the foreign free-world countries has increased at an average annual rate of 762,000 bales, resulting from an expansion in cotton acrea and higher yields. Acreage has responded to the profitability of cotton as a cash crop, as an earner of foreign exchange, and as a result of government encouragement in many countries. Yields are trending upward as a result of improve technological and cultural practices. Also, in some countries cotton acreage has been shifted to more fertile land areas with increased use of irrigation.

Consumption of cotton in foreign countries has been rising with population increases and higher levels of economic activity. Sharp advances in the use of man-made fibers, however, have modified the rise in cotton consumption. For example, during the past year cotton consumption in all foreign countries rose about 1.5 million bales, while man-made fiber consumption increased by the equivalent of 3 million bales of cotton.

Government Financing of Cotton Exports Under Specified Programs Slightly Below Year Earlier

Government financing of U.S. cotton exports under specified programs (including authorizations and loans issued but not used in previous years and those which may not be utilized in fiscal 1965-66) totaled about 145 million through November 3. This would cover shipments of an estimated 1.1 million bales. This compares with actual shipments estimated at 1.4 million bales for all of fiscal 1964-65. (See table 31.)

Export-Import Bank credits issued this year cover 0.7 million bales, up sharply from 0.5 million bales in all of fiscal 1964-65. Purchase authorizations under Public Law 480, Title I, thus far during the current fiscal year cover only 0.2 million bales. Shipments during 1964-65 totaled 0.7 million bales. (See table 31.)

Sales of upland cotton for export under the 1964-66 Credit and Barter Export programs totaled 689,690 bales during the 1964-65 marketing season. This total included 241,079 bales credit and 448,611 bales barter. During the current season, August 1 through November 3, total sales of 172,039 bales include 145,635 bales barter and 26,404 bales credit. On November 3, the average price at which the cotton was sold was 24.14 cents per pound, basis Middling 1-inch at average location.

Prices of Cotton in Import Markets Mixed

Prices for U.S.-grown cotton, c.i.f. Liverpool, increased slightly during October, while prices of most comparable foreign-grown cotton in the Liverpool market declined. Prices for U.S.-grown cotton have continued to average below most competitive growths, but, the difference has narrowed in recent months. Prices for Mexican-grown cotton have averaged above the same grade and staple of U.S. cotton since April 1963.

The price for U.S Middling 1 1/32 inch, c.i.f. Liverpool, during October averaged 26.98 cents per pound. This compares with 27.70 cents for October 1964. Liverpool prices for Mexican-grown cotton, Middling 1 1/32 inch, averaged 27.37 cents per pound during October 1965 compared with 28.32 cents a year earlier (See tables 33 and 34.) This quality of U.S.-grown cotton in the Liverpool market during October was 0.39 cent per pound below that for the comparable Mexican-grown cotton. This compares with 0.62 cent for October 1964. U.S. and foreign average spot export prices are shown in table 35.

Extra-Long Staple Stocks May Be Slightly Lower On August 1, 1966

Carryover of extra-long staple cotton on August 1, 1966, is expected to be down slightly from 259,000 bales on the past August 1. A slight decline in stocks is expected because of the much smaller American-Egyptian crop--82,500 bales in 1965, down from 116,700 in 1964. Imports of extra-long staple cotton are expected to be about the same as a year earlier. Mill consumption and exports may be slightly higher this year. (See table 9.)

- 21 -

Mill consumption of extra-long staple cotton during 1965-66 is estimated at 155,000 bales, up slightly from the past season's total of 152,000 bales. Extra-long staple cotton is meeting with intense competition for markets from non-cellulosic staple fibers. Exports of American-Egyptian cotton and exstockpile cotton this year may be little different from a year earlier.

On October 14, USDA announced a national acreage allotment of 81,400 acres for the 1966 crop of extra-long staple cotton. This compares with the 1965 allotment of 77,758 acres. Distribution of acreage allotment are shown in table 5. The new farm legislation does not amend or modify legislation now in effect pertaining to the national marketing quota and acreage allotment for extra-long staple cotton.

The average loan rate for the 1965 crop of extra-long staple cotton is 49.25 cents per pound, unchanged from the previous year. The average price received by farmers during the 1964-65 crop year for American-Egyptian cotton was 48.9 cents per pound, down from 52.6 in 1963-64. The mid-October price was 50.1 cents per pound, down from 50.8 cents in October 1964. (See table 6.)

Linter Carryover Expected To Increase In 1965-66

The 1965-66 supply of cotton linters is expected to total about 2.5 million bales, about 100,000 bales larger than 1964-65. The increased supply is primarily a result of a larger beginning carryover. The supply of linters includes estimated production of 1.65 million bales (Same as a year earlier), imports of 160,000 bales, and the beginning carryover of 669,000 bales. Domestic consumption of cotton linters is estimated at 1.4 million bales and exports at 300,000 bales. The ending carryover on July 31, 1966, probably will total about 780,000 bales, up 100,000 from a year earlier.

Consumption of cotton linters during 1964-65 season totaled 1,386,000 bales, 2 percent above 1963-64, and highest since 1959-60. Use of chemical linters totaled 653,600 bales, 6 percent above the previous year. Felting linters, at 732,500 bales, were down 1 percent from the previous year. U.S. exports of linters during 1964-65 fell 7 percent below 1963-64, while imports during 1964-65 were slightly smaller than for the previous year. (See table 36.)

Totals were made before data were rounded to thousands.

Beginning 1956 reimports no longer published. Running bales except "Net imports" which are in bales of 500 pounds, gross weight.

Adjusted to period August 1 - July 31.

Does not include picker lap imports reported by the Bureau of the Census as raw cotton.

1/ Totals were made before data 2/ Beginning 1956 reimports no 3/ Running bales except "Net in 4/ Adjusted to period August 1 5/ Does not include picker lap 6/ Imports for consumption. 7/ Freliminary. 8/ Estimated. 9/ Crop Peporting Board crop enders. 2/ Crop Reporting Board crop estimate of November 8, 1965.

10/ Includes foreign-grown cotton released from the national stockpile.

Table 1 of annual report of the Bureau of the Census, "Cotton Production and Distribution," except for 1963 and 1964 which are from subsequent Census reports.

Table 11.--Commodity Credit Corporation stocks of cotton, United States, August 1, 1965 to date

1/ Includes American-Egyptian and Sea Island.

 $\frac{2}{2}$ Includes American-Egyptian cotton transferred to CCO from the national stockpile, but does not include the foreign-gown cotton transferred from the stockpile for sale or disposition.

3/ Stocks as of July 31, 1965.

Agricultural Stabilization and Conservation Service.

Single copies of the 1965 Supplement to Statistical Bulletin No. 329, Statistics on Cotton and Related Data, issued October 1965, may be obtained from: The Office of Information United States Department of Agriculture Washington, D.C. 20250

1/ Bureau of the Census. Population continental United States as of July 1, including Armed Forces overseas. 2/ Mill consumption as reported by the Bureau of the Census. For American cotton, tare as reported by the Crop Reporting Board has been duducted; for foreign cotton, 3 percent (15 pounds) was deducted, (20 pounds beginning August 1, 1958). Since 1950, data have been adjusted to year ended December 31. 3/ Includes apparel and carpet wool on a scoured basis. Data from Wool Consumption reports of the Bureau of the Census. 4/ Textile Organon, publication of the Textile Economics Bureau, Incorporated. Includes filament and staple fibers. Data are United States producers' domestic shipments, plus imports for consumption. 5/ Textile Organon. Nylon, orlon, glass fiber, etc. United States production bess exports plus imports for consumption. 6/ Producers' man-made fiber waste consumed by mills, (excludes glass). 7/ Flax. Imports and estimated production. Bureau of the Census and Plant Industry through 1948. 1949-1952 production was estimated by the Agricultural Marketing Service, Portland, Oregon, office. Imports only since the 1953 season. 8/ Silk. Bureau of the Census. Net imports through 1933. Since 1934, imports for consumption. 2/ Total consumption divided by population and not a summation of per capita consumption of fibers. 10/ Less than 0.05 pound. 11/

Table 22 .- Raw cotton equivalent of United States exports of domestic cotton manufactures, 1960 to date

1/ Includes fabrics and tire cord and cloth for export to the Philippines to be embroidered and otherwise manufactured and returned to the United States. 2/ Includes tapestry and upholstery fabrics, table demask, pile fabrics and remnants. 3/ Includes curtains and draperies, house furnishings not elsewhere specified. 4/ Includes gloves and mitts of woven fabric. 5/ Includes underwear and outerwear of woven fabric, handkerchiefs, and wearing apparel containing mixed fibers (corsets, brassieres, and gir es, garters, armbands and suspenders, neckties and cravets). 6/ Includes canvas articles and manufactures, knit fabric in the piece, braids and narrow fabrics, elastic webbing, waterproof garments, and laces and lace articles. 7/ Includes rubberized fabrics, bags, and industrial belts and belting. 8/ 480 pound net weight bales. 9/ For monthly data beginning July 1959, see the Cotton Situation, CS-199, March 1962 and CS-209, November 1963; for annual data prior to 1960, see Statistics on Cotton and Related Data, 1925-62, issued April 1963. 10/ Monthly data may not always agree with the annual because of rounding and minor revisions in the annual report. 11/ Preliminary.

Beginning January 1, 1965, a new classification system for exports was adopted by the Bureau of the Census. Minor differences from earlier groupings may occur because of composition changes.

Table 25 .-- Man-made fiber equivalent of United States exports of domestic man-made fiber manufactures, 1960 to date

1/ Includes products made from waste. 2/ Included with cloth woven, prior to January 1965. 3/ Includes ribbons, trimmings, and braids (except hat braids). 4/ Not elsewhere classified. 5/ For monthly data beginning July 1959, see the <u>Cotton Situation</u>, CS-199, March 1962. For annual data prior to 1960, see <u>Statistics on Cotton and Related</u> Data, 1925-62, issued April 1963. 6/ Monthly data may not always agree with the annual because of rounding and minor revisions in the annual report. 7/ Preliminary.

The estimated value of cloth obtainable from a pound of cotton with adjustments for salable waste. 1/ The estimated value of cloth obtainable from a pound of cotton with adjustments for salable waste. 2/ Monthly average prices for four territory growths, even running lots. prompt shipments, delivered at Group 201 (Group B) mill points including landing costs and brokerage. Prices are for the average quality cotton used in each kind of cloth. Begind ing August 1964, prices are for cotton after equalization payments of 6.5 cents per pound have been made. The mill margins show and a state of the average are for cotton after equalization payments of 6.5 cents per pound have been made. ing August 1904, prices are for cotton after equalization payments of 0.5 cents per pound have been made. The mill margins we for April-July 1964 do not reflect the 6.5 cents per pound equalization payment made to domestic cotton users on all bales of eligible cotton opened beginning 12:01 A.M. April 11, 1964, through July 31, 1964. (5.75 cents beginning August 1965.) 3/ Markets closed. 4/ Difference between cloth prices and cotton prices.

Cotton Division, Consumer and Marketing Service.
